

New 2026

Corvette ZR1X

The Corvette ZR1 legacy continues with the addition of hybrid all-wheel drive technology. ZR1X represents the pinnacle of Corvette performance as the most advanced Corvette ever.

A true American hypercar

The turbocharged LT7 engine and electric front drive unit work in harmony to deliver unrelenting power and instant torque. With advanced AWD technology, the ZR1X offers precision handling for ultimate driver confidence—elevating Corvette to the next level as a true American hypercar.

Unrivalled performance, inspired innovation

Electrified with Twin-Turbo Boost

1. 1,064 horsepower from LT7 5.5L V8 engine plus 186 horsepower from the eAWD (electric drive unit). 2. On a closed course only. Based on initial vehicle movement.

Unlocking next-level power

Harnessing 1,064 horsepower from the LT7 engine, plus an additional 186 horsepower from the electric front drive unit, the ZR1X achieves a combined 1,250 horsepower—making it the most powerful production Corvette ever.

Innovative eAWD technology

LT7 Engine

This 1,064-horsepower, 828 lb.-ft. twin-turbo V8 is a force to be reckoned with. On engine charge air coolers and electronically controlled waste gates combine with other engine controls to virtually eliminate turbo lag and deliver more power in less time. A unique cylinder head casting optimizes the intake and exhaust system for the turbocharged application. The flat-plane crankshaft provides the quick high-revving glory of the LT7 engine.

Transmission

Responsive performance is at the core of the 8-speed dual-clutch transmission. Near-instant gear changes are coupled with the variable Drive Style Index, allowing the ZR1X to intelligently anticipate driver input and quickly react with gear holds and downshifts.

Battery

A 1.9 kWh lithium-ion battery electrifies the ZR1 for the first time, powering the electric drive unit that controls the front wheels.

Battery energy for the ZR1X was expanded by 26% compared to the E-Ray, enabling more consistent track lapping.

The self-charging battery system features integrated power electronics for maximum responsiveness, efficiency, and performance.

Electric Drive Unit

The electrified motor powering the front axle produces 186 horsepower and adds 145 lb.-ft. of torque to the front wheels, enhancing acceleration off the line, through corners, and in passing maneuvers.

The system also offers limited EV-only drive modes at speeds up to 45 mph for 3-4 miles, allowing for whisper-quiet operation to discreetly move your car or exit your neighborhood when needed.

AWD

The state-of-the-art eAWD system constantly monitors and adapts to tire conditions, delivering maximum traction and optimal chassis balance.

Paired with the near-instant torque of a front electric motor, the result is lightning-fast response and a driving experience that inspires total confidence.

A close-up, high-contrast photograph of a Corvette ZR1X's carbon ceramic brake system. The image shows a black, multi-spoke carbon fiber wheel with a central Corvette emblem. Behind the wheel, a large, perforated carbon ceramic rotor is visible. A red Alcon brake caliper is mounted over the rotor, featuring the Alcon logo and 'CORVETTE' branding. The tire is a Michelin Pilot Sport Cup 2 R. The overall aesthetic is dark and technical, emphasizing the high-performance nature of the vehicle.

Ultimate stopping power

ZR1X's standard carbon ceramic brakes – Corvette's largest ever – are engineered for ultimate performance. Massive 16.5-inch front and rear rotors pair with Alcon® 10-piston front and 6-piston rear calipers to deliver superior heat resistance and ultra-responsive braking for maximum control.

Cutting-edge aerodynamics

Purposefully designed wide side air inlets, carbon-fiber elements, and a multitude of airflow and cooling features result in the ZR1X creating over 1,200 pounds of downforce at top speed, the highest of any production Corvette.¹

Driver-centric technology

ZR1X offers cutting-edge technology that is both functional and intuitive, seamlessly integrating hardware and software for an enhanced driving experience.

Performance Data Recorder

Performance Data Recorder (PDR) in ZR1X is a standard onboard system that uses video, audio, GPS, and vehicle data to capture and analyze your driving performance—especially on the track. Fully integrated into the vehicle's displays, it delivers real-time speed tips, graphical lap analysis, and side-by-side video playback to compare different sessions or drivers. With no laptop or phone required, PDR puts powerful coaching and performance insights right at your fingertips.

Performance App

The fully customizable Performance App displays real-time performance data through live graphs, timers, and gauges—all designed to help you monitor and maximize capability. Live graphs showcase horsepower and torque over time, while performance timers capture 0–60, 0–100, quarter-mile, and custom rolling start metrics up to top speed. Intuitive gauges track g-force, vehicle vitals, battery status, and maintenance insights in real time. A Vehicle Summary screen highlights power, boost, and electric charge figures, giving you a dynamic and complete view of ZR1X's electrified capabilities.

All-electric Stealth & Shuttle Modes

Activate Stealth Mode for a whisper-quiet departure using electric power alone. This all-electric mode allows you to drive for 3–4 miles at speeds up to 45 mph without engaging the engine. Perfect for early morning starts or discreet departures, it delivers a smooth, subtle driving experience. Shuttle Mode uses the electric motor to maneuver quietly at speeds up to 15 mph—ideal for moving through garages, showrooms, or tight spaces with precision and ease.

Performance technology

Performance Traction Management (PTM) is an advanced, integrated system that adjusts traction control, stability control, and power delivery through driver-selectable modes—including PTM Pro-- each designed to optimize performance across a variety of track driving conditions.

PTM Pro Mode:

ZR1X unlocks the full potential of PTM Pro Mode to deliver the purest driving experience. Combined with the eAWD vehicle dynamics, these features unleash precision handling and the fastest possible lap times.

Regen Brake Torque Vectoring:

Engineered to recover peak energy without sacrificing agility. While trail braking into a racetrack corner with maximum regenerative recovery, the advanced controls bias rear inside brake pressure to maintain optimal chassis balance.

Front Axle Pre-Control:

Actively manages inside front brake pressure to control on-throttle wheel flares, ensuring consistent grip and composed handling at the limit.

Racetrack Electric Energy Strategies

ZR1X also features specialized energy strategies designed to maximize electric output based on specific track session demands:

- **Endurance:** Optimized for extended lapping and consistent eAWD performance.
- **Qualifying:** Energy optimized for ultimate one-lap pace. Designed to break track records.
- **Push-to-Pass:** Maximum power is unleashed — delivering a surge of acceleration designed for overtaking competitors on the track.
